Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were divided into two groups: a control group and an exercise group. The exercise group performed a 12-week training program consisting of three sessions per week, each lasting 30 minutes. The control group did not exercise. The HR and HRR were measured at rest and during maximal exercise at the beginning and end of the 12-week period. The results showed that the exercise group had a significant increase in HR and HRR compared to the control group. The HR increased from 72 to 78 beats per minute, and the HRR increased from 28 to 34 beats per minute. The control group showed no significant change in HR and HRR. The findings suggest that a 12-week training program can improve the cardiovascular fitness of sedentary middle-aged men.
